TITLE: Bone grafts

#### Detailed Description Text (39):

In a preferred embodiment, an osteogenic composition is provided to the pores of the load bearing member. The bone growth inducing composition can be introduced into the pores in any suitable manner. For example, the composition may be injected into the pores of the graft. In other embodiments, the composition is dripped onto the graft or the graft is soaked in a solution containing an effective amount of the composition to stimulate osteoinduction. In either case the pores are exposed to the composition for a period of time sufficient to allow the liquid to thoroughly soak the graft. The osteogenic factor, preferably a BMP, may be provided in freeze-dried form and reconstituted in a pharmaceutically acceptable liquid or gel carrier such as sterile water, physiological saline or any other suitable carrier. The carrier may be any suitable medium capable of delivering the proteins to the spacer. Preferably the medium is supplemented with a buffer solution as is known in the art. In one specific embodiment of the invention, rhBMP-2 is suspended or admixed in a carrier, such as water, saline, liquid collagen or injectable BCP. The BMP solution can be dripped into the graft or the graft can be immersed in a suitable quantity of the liquid. In a most preferred embodiment, BMP is applied to the pores of the graft and then lypholized or freeze-dried. The graft-BMP composition can then be frozen for storage and transport.

=> s articular cartilage regeneration and osteochondral graft and BMP
L1 2 ARTICULAR CARTILAGE REGENERATION AND OSTEOCHONDRAL GRAFT AND BMP

=> d l1 ti abs ibib tot

L1 ANSWER 1 OF 2 USPATFULL on STN

Device for regeneration of articular cartilage and other tissue
An implantable device for facilitating the healing of voids in bone,
cartilage and soft tissue is disclosed. A preferred embodiment includes
a cartilage region comprising a polyelectrolytic complex joined with a
subchondral bone region. The cartilage region, of this embodiment,
enhances the environment for chondrocytes to grow articular cartilage;
while the subchondral bone region enhances the environment for cells
which migrate into that region's macrostructure and which differentiate
into osteoblasts. A hydrophobic barrier exists between the regions, of
this embodiment. In one embodiment, the polyelectrolytic complex
transforms to hydrogel, following the implant procedure.
